

MEASURED SAVINGS, NOT EQUIPMENT SALES

Industrial electricity costs, turned into **measured savings**

We help businesses diagnose, protect, optimise, generate, finance and prove energy savings

WattZap Energy Solutions is an industrial energy-savings and optimisation company for Indian industrial and commercial customers — starting with rice mills and energy-intensive SMEs.

- Industrial and commercial focus

- One structured end-to-end journey

- Outcomes measured, not promised

WattZap Energy Solutions · Naveen Badarla, Founder · 2026

The bill shows the cost — **not what causes it**

One visible number, shaped by many hidden factors

What the bill shows

- The final amount, units consumed and the due date
- Penalties and charges, buried in line items
- A number that arrives after the money is spent

What stays hidden

- Demand, power factor and time-of-use behaviour
- Tariff category, contract demand and billing accuracy
- Machine loading, schedules and solar performance

What owners cannot see

- Which part of the bill was avoidable
- Whether the cause is operational, technical or contractual
- Whether promised savings actually materialised

- Customers know what they paid — not what they could have prevented

Many vendors — no owner of the **savings outcome**

Each provider solves a part; the customer must connect the pieces

Equipment vendors

- Solar EPCs sized to the roof, not the load
- Electrical contractors and APFC suppliers
- Meter vendors selling hardware, not answers

Software & data

- Dashboards that show data, not decisions
- Monitoring tools disconnected from the bill
- Reports that end where implementation begins

Auditors & advisors

- Audit reports without an owner for follow-through
- Maintenance providers fixing symptoms
- Recommendations that stop at the report

Financiers

- Capital offered without savings evidence
- Projects appraised without measured baselines
- No one accountable for the final outcome

The customer's unanswered question: what actually reduced my bill — and by how much?

WattZap begins with the **opportunity**, not a product

The intervention follows the evidence

Understand first

- Build the baseline from bills and site data
- Identify what is actually driving cost
- Separate assumptions from measured opportunities

Act on evidence

- Prioritise high-confidence actions first
- Implement only what is needed
- No predetermined product to push

Prove, then expand

- Measure the actual result against the baseline
- Expand only after value is demonstrated
- Every step earns the next one

- Diagnosis before investment; verification after implementation

One journey from diagnosis to **proven savings**

Modular by design — start small, unlock stages as value is established

- Begin with an EnergyScan on existing bills and data

- No customer needs to purchase everything upfront

- Each stage unlocks as evidence accumulates

Every engagement begins with **evidence**

EnergyScan separates assumptions from measurable opportunities

EnergyScan Lite

A first screening from existing bills

- Initial bill screening and qualification
- High-level identification of opportunity areas
- Preliminary savings areas, at no obligation

● The foundation

EnergyScan Pro

A detailed diagnosis of the whole site

- Detailed bill, tariff and interval-data analysis
- Site, equipment and load-profile assessment
- An agreed baseline for future verification
- A prioritised implementation roadmap

The output is a prioritised action plan — not an audit report that sits on a shelf.

The fastest savings **stop losses** already occurring

WattZap Guard — one protection layer around the electricity bill

PF Guard

- Identifies power-factor penalties and their causes
- Reduces reactive-power exposure
- Verifies that penalties actually fall

Demand Guard

- Tracks demand against sanctioned limits
- Flags spike patterns and what they cost
- Controls demand charges before they recur

Bill Guard

- Checks every bill for anomalies and errors
- Flags tariff issues and inconsistencies
- Supports recovery where money is owed

Solar Guard

- Verifies solar delivers what was promised
- Flags underperformance and downtime
- Values lost generation in rupees

Protection comes before expansion — the four Guards work as one layer, not separate products.

Use the existing site more **intelligently** first

EMS Lite and EMS Pro — monitoring that leads to better decisions

- Monitoring is only valuable when it changes decisions

- Optimise before adding more infrastructure

Solar sized to your **energy reality**, not your roof

Generation and storage follow the load — never the other way round

Sized to the site

- Daytime load, operating hours and seasonality
- Export limits, tariffs and demand profile
- Capital availability, payback and risk

The right assets

- SolarFit: right-sized, evidence-based design
- Owned, leased or PPA-structured solar
- Solar-plus-storage and battery optimisation

Performing for years

- Solar performance monitored continuously
- Underperformance valued and corrected
- Future-ready for EV-charging optimisation

- The goal is customer value, not installed capacity

Commercial structures **matched** to the opportunity

A valuable project should not fail only because of upfront capital

Customer-funded

Full ownership where capital is available

- Customer owns the asset and the savings
- Fastest route where capital is available
- WattZap implements and verifies

Lease & PPA

Structured access without heavy capex

- Lease, hybrid lease or solar PPA
- Little or no upfront investment
- Payments structured below expected savings

Savings-linked

Fees that follow verified results

- Shared-savings and performance-linked fees
- Revenue-share and selective asset financing
- Measurement capability is the precondition

The structure depends on savings confidence, creditworthiness, asset ownership, risk and duration — no model is promised universally.

Savings are **credible** when the maths is visible

Agreed baseline – adjusted actual cost = verified savings

Agreed baseline

- The 'before' cost, agreed before changes
- Built from bills and measured site data
- The reference every result is checked against

Adjusted actual

- Measured cost after implementation
- Agreed adjustments: production, hours, tariffs
- Seasonality and extraordinary events included

Verified savings

- Attributed by source: penalties, billing, operations, solar
- Monthly reports for customers and financiers
- Tracked continuously, not claimed once

• WattZap's role continues after implementation

• [Insert verified pilot result when available]

From site data to financial decisions

A modular architecture — start with today's data, expand where value appears

Site data

Bills & existing site data

Existing meters & equipment

Sub-metering where needed

Connectivity

WattZap Edge site gateway

Secure data collection

Intelligence

Analytics & decision logic

Alerts & recommendations

Control where enabled

Outcomes

Customer dashboard

Savings-verification reports

Not every customer needs the full architecture on day one — visibility expands only where it creates value.

Start focused, **prove value**, then scale

Beginning where savings are material, measurable and repeatable

WATTZAP ENERGY SOLUTIONS

Start with one site and one EnergyScan

Measured savings, not equipment sales

WattZap gives industrial customers a structured, accountable way to understand electricity costs, stop avoidable losses, improve operations, invest intelligently and verify the savings achieved.

- Share recent electricity bills to begin
- Pilot one high-confidence opportunity
- Expand only after value is proved
